

Transform your face!

If you are really serious about reducing your age by 10 years, this is the right procedure for you! A Facelift surgery removes excess skin and repositions fat and muscles to correct jowls, lower face sagging, and neck laxity which naturally occur with aging.

The skin and muscle of the face are separated, lifted and then re-draped to a more youthful-appearing position. Facelift surgery is performed on an inpatient basis under general anaesthesia, and usually takes 2 to 4 hours. Most patients return to work within 2 weeks.

Browlift

The Eyebrow forms an important aesthetic unit of your face, and a droopy brow gives a tired look. Forehead Lift repositions the eyebrows and smoothes the forehead to address this sign of aging.

It is often combined with a Blepharoplasty, and the result is a more youthful and rested appearance to the forehead and upper eyelids, and a softening of lines in the forehead and between the eyes.

Consultation

Every face is unique, and there are several options to rejuvenate it and give you a younger look! A consultation would help you understand what is right for you.

Get in touch with us, and we shall rewind your age!

Iron out the wrinkles in your life!

You may have read about it, seen on television, or heard hush-hush whispers about BOTOX® parties! Botulinum toxin relaxes the muscles that cause dynamic skin wrinkles.

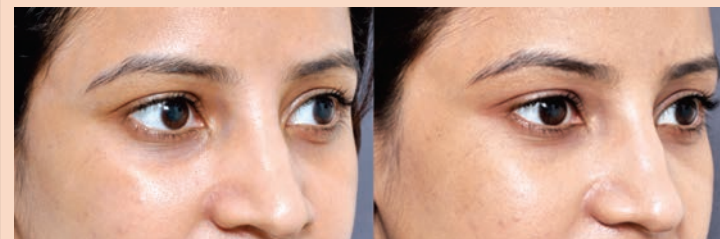

This simple and quick out-patient procedure with no downtime gives an anti-wrinkle effect that can last for 3-4 months.

Wipe out the under eye hollows and dark circles!

No, you don't need to be a celebrity or a movie star to look better! A Filler can create great enhancements on your face, such as eliminating the under-eye hollows, dark circles, and provide volume enhancement in areas such as lips and cheeks.

It is a 20-minute out-patient procedure with minimal discomfort and no downtime. Its effect lasts for nearly a year or more, and enhancement is equally easy!

Autologous fat transfer

For those who like the filler effect, but want it for a longer duration, what better than your own fat?!

Autologous fat transfer is a well-established technique of moving fat from one area of the body to another to improve contours such as the cheeks, under the eyes, the lips, and jawline. It is harvested through a liposuction canula (tube) from the tummy area or hips and carefully prepared for re-implantation of the cells. The fat is then injected into the desired locations. Incisions are typically limited to small puncture wounds less than 0.2 cm in size. Fat transfer is longer lasting compared to filler injections, and it may last for several years. However, this is a surgical procedure.

LASER eyelid lift (Blepharoplasty)

Did you know, that you don't need to live with those fat bags and hanging skin folds around your eyes? Blepharoplasty procedure can remove these cosmetic blemishes through hidden incisions, resulting in a more youthful, rested appearance of the eyes.

Blepharoplasty is a day care procedure performed under local anesthesia, and takes less than an hour. Discomfort is minimal, and with a social downtime of 5-7 days, you are introduced to a rejuvenated you!
